Riemann Outflow Boundary Condition Flux

- · Riemann Flux BCs everywhere is ideal
- · Velocity not known a priori traditional Riemann BCs not applicable
- Weak-pressure prescription ill-posed for recirculation

Solution

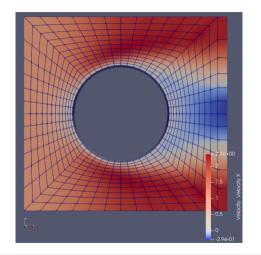

- · Calculate F_i^{adv} via Riemann solver, setting $u_i^{\text{ext}} = u_i^{\text{int}}$
- · Calculate F_i^{diff} from solution, then $F_i = F_i^{\text{adv}} + F_i^{\text{diff}}$

Riemann Outflow Boundary Condition Flux

Viscous Outflow Boundary Conditions Demonstration

- · Cylinder in cross flow torture test
- · Stable for significant outflow recirculation
- \cdot Only p and T set at boundary

Efficient Implicit Timestepping

Implicit Timestepping

Implicit timestepping requires solving:

$$\frac{\mathrm{d}\mathcal{G}(\boldsymbol{Y}_{,t},\boldsymbol{Y})}{\mathrm{d}\boldsymbol{Y}}\Delta\boldsymbol{Y} = -\mathcal{G}(\boldsymbol{Y}_{,t},\boldsymbol{Y})$$

Implicit Timestepping

Implicit timestepping requires solving:

$$\frac{\mathrm{d}\mathcal{G}(\boldsymbol{Y}_{,t},\boldsymbol{Y})}{\mathrm{d}\boldsymbol{Y}}\Delta\boldsymbol{Y} = -\mathcal{G}(\boldsymbol{Y}_{,t},\boldsymbol{Y})$$

- Store $\frac{d\mathcal{G}}{d\mathbf{V}}$ directly (sparse matrix representation)
 - · Pros: Opens up preconditioning options
 - · Cons: Is large, expensive to store

$$\frac{\mathrm{d}\mathcal{G}(\boldsymbol{Y}_{,t},\boldsymbol{Y})}{\mathrm{d}\boldsymbol{Y}}\Delta\boldsymbol{Y} = -\mathcal{G}(\boldsymbol{Y}_{,t},\boldsymbol{Y})$$

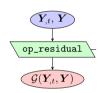

- Store $\frac{d\mathcal{G}}{d\mathbf{v}}$ directly (sparse matrix representation)
 - Pros: Opens up preconditioning options
 - · Cons: Is large, expensive to store
- Finite difference matrix-free approximation:

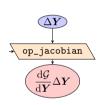

$$\frac{\mathrm{d}\mathcal{G}(\boldsymbol{Y}_{\!,t},\boldsymbol{Y})}{\mathrm{d}\boldsymbol{Y}}\Delta\boldsymbol{Y}\approx\frac{\mathcal{G}(\boldsymbol{Y}_{\!,t},\boldsymbol{Y}+\epsilon\Delta\boldsymbol{Y})-\mathcal{G}(\boldsymbol{Y}_{\!,t},\boldsymbol{Y})}{\epsilon}$$

- · Pros: Just need a residual evaluation, cheap (in programming and computation)
- Cons: Accuracy limited to $\sqrt{\epsilon_{\text{machine}}}$, preconditiong require partial assembly

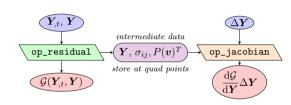

$$\frac{d\mathcal{G}}{d\mathbf{Y}}\Delta\mathbf{Y} = \frac{d}{d\mathbf{Y}} \left[\mathcal{P}^T \mathcal{E}^T B^T G B \mathcal{E} \mathcal{P} \right] \Delta \mathbf{Y}$$
